Artificial Intelligence

Over the years, Artificial Intelligence has gotten more sophisticated with new technologies that break the boundaries of what humans are capable of. The infographic presented details of how AI started to surface in 2010, when Apple unveiled AI assistant, Siri. From there, we have accomplished many things like being able to beat humans in board games to create AI Models that can recognize and create images from a simple prompt. Companies like Google have been experimenting with AI for over 20 years. Google started to implement Machine Learning for spell check when using the search engine in 2001. In recent years, they have accomplished many milestones, including the implementation of AI principles for companies creating AI solutions as well as Quantum milestones that help solve computational task much faster (Google, 2025).

According to the AI Timeline, the most recent advancement has been Google's Genie 3. "Given a text prompt, Genie3 can generate dynamic worlds that you can navigate in real time at 24 frames per second, retaining consistency for a few minutes at a resolution of 720p" (Parker-Holder and Fruchter, 2025). It is incredible what Artificial intelligence has advanced over the years, from helping users spell check to creating digital worlds that one can navigate through and explore. This puts in question: what is the limit with AI and Humans? As new advancements are discovered, more problems are ensured, such as hardware limitations or climate effects because of the heat produced by these AI servers. However, each innovation has proven that AI can be used in any situation with the right tools.
